```
C++ and Data Structures (60 Minutes)
      Evaluate the following for fn (7);
1.
        int fn(int v)
            if(v==1 || v==0)
            return 1;
            if(v%2==0)
            return fn(v/2)+2;
            else
            return fn(v-1)+3;
            11
      1.
      2.
            10
      3.
            9
2.
      My salary was increased by 15%!"
      Which of the following statement will EXACTLY print
      the line of text above?
      1.
            printf("My salary was increased by 15%!\n");
            printf("My salary was increased by 15'%'!\n");
      2
            printf("\"My salary was increased by 15/%\\\"n");
      3.
            printf("\"My salary was increased by 15%% \\"n");
      Why should we not use non-integer real numbers as
      counters in loop?
            Because they are not allowed in loop
      2.
            A slight imprecision in repeating numbers
            can cause the loop to repeat infinitely.
      3.
            Because they use more space
            Because they are slow and less efficient
      4.
            than integers
     If a process does x.signal, where x is a condition
     variable of a monitor and no process is awaiting
      condition x, What will happen?
            The signal operation has no effect
      2.
            The next process do x.wait does not get
            blocked
     3
            The next process do x.wait get blocked
     4.
            None of the above
     Is the below statement is True/False?
     The sequence of instructions (used in Processes)
     using mutex semaphore
       Up(mutex);
               Critical section
       Down(mutex);
     satisfies mutual exclusion.
     1
           True
     2.
           False
     3.
           Cannot say
           None of the above
     What will be the output of the following program?
     #include<stdio.h>
     #include<string.h>
     char *getptr()
      static char ptr[10] = "123456789";
      return ptr;
     void main()
```

char *ptr="00000";

```
strcpy(getptr()+4,ptr);
        ptr=getptr();
        strcpy(ptr,"12345");
        printf("%s",getptr());
             123456789
      2.
             1234500000
      3.
             12345
             Run time error
      What will be the output of the following program?
7.
      #include<stdio.h>
      void main()
        int x = 5;
        int y = 2;
        char op = '*';
        switch (op)

                                                                           y->Create();
      4.
      In case of a copy constructor, which of the following
                                                                               Base class Window
                                                                        1.
      is true?
      a. Used to instantiate an object from another
                                                                        2.
                                                                               Derived class Command Button
                                                                               Base class Window Derived class Command
                                                                        3.
          existing object
```

b. To copy one object to another existing object

Button

```
4.
       Derived class Command Button Base class Window
Which of the following is an example where copy
constructor is needed?
a. User-defined copy constructor is required
    when deep copy is required
b.
    Cloning of objects in Prototype pattern
 1.
       Only a
2.
       Only b
3.
       Both a and b
4.
       None of the above
In addition to c-style, which casts can be used to
cast an int into an enum?
       dynamic_cast
       static cast
 2.
 3.
       reinterpret_cast
       None of the above
What will be the output of following program?
 #include<iostream.h>
 void main()
  int a;
  bool b;
  a = 10 > 20;
  b = 10 >= 20;
  cout<<a<<" "<<b<<endl;
       00
2.
       01
3.
       11
       10
4
Which lines of code below should cause the
program to be undefined?
 1 struct Foo
 2{
 3
    virtual ~Foo() {}
 4);
 6 struct Bar : public Foo
 71
 8 };
 9
10 int main(int argc, char** argv)
12 Foo* f = new Bar;
13 delete f;
14 f = 0;
15 delete f:
16
17 Foo* fa = new Bar[10];
18 delete fa;
19 fa = 0;
20 delete fa;
21
22
   return 0;
23 }
      13
1.
2.
      15
3.
      18
      20
What will be the output of following program?
#include<iostream.h>
void main()
  int arr[][3]={0,10,20,30,40,50};
  int *a = &arr[0][0];
```

```
cout<<arr[1][2]<<" "<<*(a+3);
       1.
             30 50
      2.
             50 30
      3.
             Compile time error
             Run time error
      4.
25.
      Which of the following statements is NOT true?
          Operators can be overloaded when both
           operands are of built-in types.
          Operators can be overloaded when one
           operand is of a built-in type and the other is of
           user-defined type.
          Operators can be overloaded when both
           operands are of user-defined types.
      1.
             Only a
      2.
             Only b
      3.
             Both b and c
             Both a and c
      When must template functions have explicit
26.
      template parameters?
             When the template types cannot be inferred
      2.
             Never, the template types can always be inferred
      3.
             None of the above
      What will be the output of the following program?
      #include<iostream.h>
      int main()
       int x = 0x1000;
        x = x << 32;
       cout << hex << x;
       return 0;
             32
      1.
             1000
      2.
             0xFFFFFFF
      3.
      4.
             0x00000000
      A friend function can access
28.
      1.
             Not even public members of class
      2.
             Only public members of class
             Only public and protected members of class
      3.
             Public, protected and even private members
             of the class
      Which one of the following is true regarding the
29.
      compiling and running of the following line
         ptr->Fn();
        If ptr is a pointer to type Q and Fn() is a virtual
        function in class Q?
             function name and function definition both
             matched to type of pointer at compile time
             function name matched to pointer type at
      2.
             compile time;
             function definition matched to type pointer
             points to at run time
             function name matched to pointer type at run
      3.
             function definition matched to type pointer
             points to earlier, at compile time
            function name and function definition both matched
            to type of object pointer points to at run time
30.
      Consider the following code:
      void negate(int& x)
          x = -1 * x;
```

| | What would happen during a call "negate(y);" in | 40. | The average time as will be |

- 48. Which of the following statement is false?
 - a. Linked list are not superior to STL vectors.
 - Deleting a node in a linked list is a simple matter of using the delete operator to free the nodes Memory
 - 1. Only a
 - 2. Only b
 - Both a and b
 - None of the above
- 49. Which of the following is a definition of a printAll() method for the List class that relies on an overloaded << method for Person to print the contents of the list?</p>
 - 1. void List::printAll()
 {
 for(ListNode *ptr = tail; ptr; ptr = ptr->next)
 cout << *(ptr->person);

 - 3. void List::printAll()
 {
 for(ListNode ptr = head; ptr; ptr = ptr->next)
 cout << (ptr->person);
 - }
 4. void List::printAll()
 {
 for(ListNode *ptr = head; ptr; ptr = ptr->next)
 cout << *(ptr->person);
 }
- Complexity of Kruskal's algorithm for finding the minimum spanning tree of an undirected graph containing n vertices and m edges if the edges are sorted is ______.
 - 1. O(m)
 - 2. O(m+n)
 - 3. O(n)
 - 4. None of the above
